

Making the website for this project has been a fascinating experience, especially considering my original goals from assignment 1. My idea for A1 was to create a straightforward, useful website that highlighted my projects and professional reputation. I can now clearly see how much the website I created for this assignment has changed and improved.

The current website from A1 is far more feature-rich and well-polished than my expectations were. I've been able to design a dynamic and interactive user experience by utilizing HTML, CSS, and JS. The website is now accessible on various devices thanks to the use of responsive design principles, which is a major advance over the static design in A1. The use of JS features is one thing that sticks out. These features, which range from notifications to form validation and event handling, have deepened the website's interaction. Specifically, the colour switcher option was difficult to create but worthwhile. It not only improves the website's aesthetic appeal but also shows how well I understand how to integrate JS and CSS. Another important factor that I focused on more in this assignment than in A1 was accessibility. I made sure the website is accessible to people with impairments by using browser developer tools to do extensive testing and according to international accessibility criteria. Since A1, I have made substantial progress in this area, which is indicative of my improving understanding of inclusive design concepts.

Now that the course is over, when I consider if I can utilize this website for what it was designed for, I think the answer is definitely yes. My professional biography, projects, and talents are effectively displayed on the website. This kind of reflecting area gives the website a more personal touch by allowing me to share my ideas and experiences. Still, there's always space for development. In the future, I hope to improve both the user experience and the visual appeal of the website. This could entail improving performance, introducing more varied material, and fine-tuning the layout. I also intend to keep learning about and experimenting with new tools and methods in order to stay current in the ever changing web development industry.

All things considered, this assignment has been a priceless learning opportunity that has helped me implement and build upon the principles I've studied throughout the course. My technical proficiency has increased, but it has also helped me to appreciate accessibility and user-centric design on a deeper level. I am pleased with the website I have made and am eager to continue improving it.
